

# MULTI SENSE

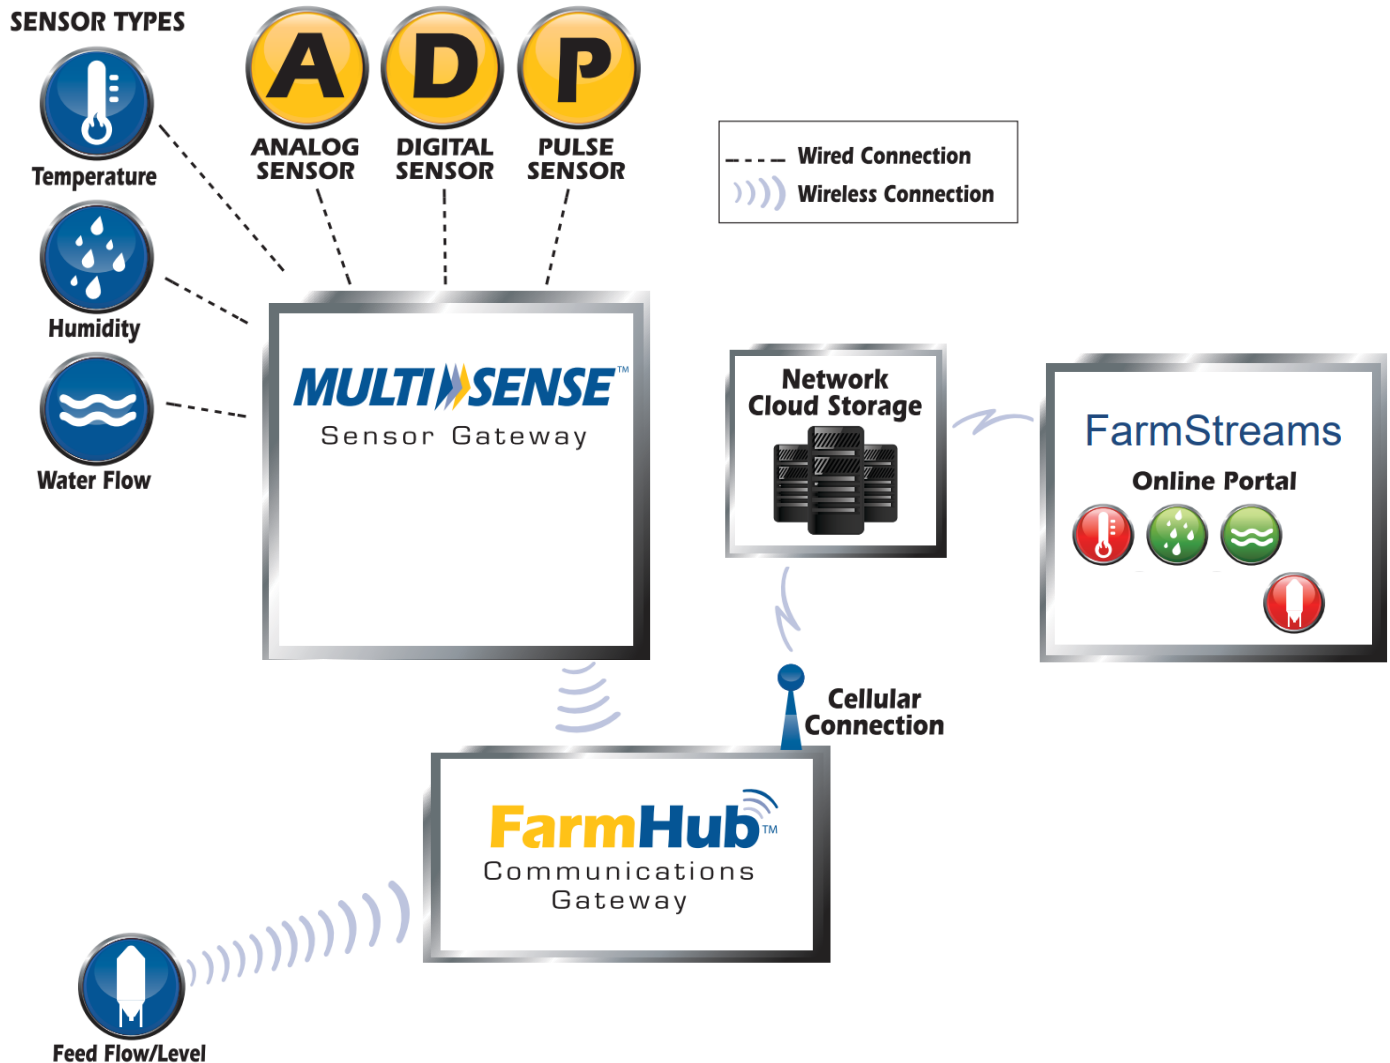

## Sensor Gateway

Critical barn performance data and alerts are now available to you and your supply chain partners anywhere in the world. The Feedlogic Multisense Sensor Gateway has 16 connections for digital, analog and pulse style sensors. The platform wirelessly connects to the Feedlogic Farm Hub and sensor data is made available to the web-based FarmStreams portal system.

Temperature, humidity, water usage and other sensors types are easily connected to the MultiSense. The sensor information can be accessed across the supply chain (with different access rights) from the chore person at the barn to the site supervisor, the live production team, and authorized third parties. Intelligent alerting features allow you to set alarm thresholds by site and notify specific people when an alert condition is detected, such as high temperature or low water usage.

The **MultiSense Sensor Gateway** integrates seamlessly into the FarmStreams data management system.
